## PRESENTATION

*This year is the eight edition of our Sono-Elastography Meeting and like, in the past editions, our aim is to provide a unique and practical approach to new technical development of Sono-Elastography and to its wide clinical application. Sono-Elastography is an ultrasound-based imaging technique that has enhanced the diagnostic capabilities of clinical ultrasonography. This edition of the Meeting is designed to address practical concerns of healthcare professionals on how to obtain good quality imaging and diagnostic insight on different equipment. The general experience with Sono-Elastography is growing with time, thus we have built the meeting as an occasion to try different approach from different vendors practically on both models, phantoms and real patients during hospital routine on small groups. Sono-Elastography adds valuable information to the study of all organs, potentially resulting in “a virtual biopsy”. As different elastographic modalities are available, our aim is also to help understanding which one is best suited for any given indication and which information can be obtained when using it. During this meeting the clinical applications and recent advances on Sono-Elastography will be analyzed with speakers coming from several countries and with the participation of commercial representatives. We welcome you in this meeting of clinicians and scientists that combine their knowledge and experience in the innovations of US”.*
